ABSTRACT

Systems and methods for scheduled recording of multimedia content streams are described herein. A scheduled recording service (SRS) is configured to receive information about a multimedia content stream provided by a device in a computer network and schedule a recording of the multimedia content stream at a specified time. At the specified time, the scheduled recording service receives the multimedia content stream from the device and saves the multimedia content stream in local system storage. A scheduling application (SA) is configured to provide a user interface for interacting with the scheduled recording service.
